**EnvirEau Technologies Inc – Innovating for a greener world with mineral-based anti-microbials**

Cyanobacteria, E.coli and a few other micro-organisms are emerging as the nemesis of many water treatment, horticulture and food processing professionals.

EnvirEau Technologies Inc. (ETI), is a private Canadian corporation focused on developing, manufacturing and marketing environmentally responsible anti-microbial concentrates. ETI's proprietary technology uses nano sized ions of natural minerals such as copper, zinc, silver and others to protect water and food from biological contamination over extended periods. The products using this technology protect the health and well-being of humans, livestock, crops and foodstuffs from a broad spectrum of bacteria, algae, fungi and/or parasite contamination. These products are now proven and established in Canada and in 8 overseas markets in water treatment applications. They are registered by PMRA (Health Canada) and certified by NSF International (Standard 60 – drinking water) as well as by numerous governments in export markets. These ionized mineral-based products have set new standards for safety, efficacy and economy in water treatment for municipal, agricultural, horticultural and food processing applications.

EnvirEau Technologies has recently been named as one of Canada's Top 10 Cleantec Companies notably because EnvirEau products provide eco-responsible alternatives to synthetic disinfection chemicals.
